

HOME PAGE

I have attached my `index.html` existing `style.css`, and the project assets.

I have already completed the HTML structure and functionality. I only need help designing the CSS.

Design a clean, modern, responsive landing page for my frontend-only web application called **Campus SnackPass**, built for SASTRA University.

The application allows students to browse campus canteens, view menus and order food before arriving.

Use a warm cream background, deep green as the primary color, muted blue as a supporting accent and orange only for primary actions such as buttons.

The landing page should include:

- Sticky navigation bar
- Large hero section with headline, description and CTA
- Hero food collage image
- Responsive canteen cards with hover effects
- Features section with modern cards
- Simple footer

Keep the design spacious and minimal with soft shadows, rounded corners and subtle animations.

Do not change my HTML structure unless absolutely necessary. If additional classes or IDs are required, list them separately before the CSS instead of rewriting the HTML.

Return only the CSS and any required HTML class additions.

The css i provided is just my initial attempt at declaring the root vars and letting the color pallet known to u , you are free to modify the css as long as the color which i wanted stays the same

MENU PAGE

I have attached my `menu.html`, `menu.css`, `menu.js` and `style.css` along with home page screenshot , style and screenshot is a ref of color for u and shld only be used for that

The JavaScript functionality is already complete. I only require help styling the page.

Design the menu page using the same visual theme as the landing page.

Style the following components:

- Canteen header
- Search bar
- Category filter pills
- Price sorting buttons
- Responsive menu cards
- Quantity controls
- Selected menu card state
- Floating cart summary
- Right sidebar cart
- Success modal after checkout

Use consistent spacing, typography, shadows and hover animations throughout the page.

Keep the layout clean and intuitive. Focus on readability and ease of use rather than decorative effects.

Do not modify the JavaScript logic.

Prefer reusable class-based CSS over complex child selectors. If additional classes are required, specify them separately before the CSS.
